

Counterfeit Parts Mitigation and Inspection Training

**Presented by
Debra N. Eggeman
Executive Director
Independent Distributors of Electronics Associations**

www.IDofEA.org

For ERAI Executive Conference Track 1: Part 2

Welcome!

I am so pleased you are here!

Training Track 1:

Proficiency in Counterfeit Identification Methods - Verification of Purchased Product

Adjusting Expectations

- The inspection for the detection of counterfeit parts is a difficult task.
- Understanding is a constantly moving target.
- Other than *perhaps* the IP holder one can not authentic or verify that an electronic part is *not* counterfeit.
- One can look for indicators and compare to Industry standards, papers, and experience

Adjusting Expectations

- There for the title of this Track is changed to...

Training Track 1:

Proficiency in Detection of Counterfeit Indicators

Adjusting Expectations

- The based on ALL findings make a determination.
- Today we are focused on blacktopping detection.
- Probably one of the most difficult areas.
 - Dealing with personnel, storage, and use safety due to chemicals-MSDS
 - Dealing with varied applications of blacktop material
 - Dealing with constant more sophisticated means and techniques by counterfeiters.

Track 1; Part 2

- MIL-STD-883, Method 2015.13
 - o Acetone
 - o 1-Methyl 2-Pyrrolidinone
 - o Dynasolve 750
 - o Scrape test

Track 1; Part 2

- Discuss the relevance of existing marking permanency and resistance to solvents screening

Track 1; Part 2

- Demonstrate the proper application of the below noted screening processes and reveal evidence (using case studies, photos, etc.) of prior use, refurbishing and resurfacing detected as a result.
 - MIL-STD-883, Method 2015.13
 - Acetone
 - 1-Methyl 2-Pyrrolidinone
 - Dynasolve 750
 - Scrape test

Track 1; Part 2

- Provide guidance relative to safety including proper personal protective equipment, ventilation and ignition sources.
- Assist attendees in ensuring false positive or false negative results are not generated during screening and address concerns that have arisen relative to applying certain screening processes to older date code parts.

Track 1; Part 2

- Provide evidence of these processes being applied to known "golden" parts and demonstrate how the results compare to the processes being applied to suspect counterfeit parts.
- Address frequently asked questions and concerns during open discussion relative to the above noted techniques.

- Marking differences

© IDEA www.idoiea.org

Terms and Definitions

Acceptable:

Product meets all contractual requirements of the Original Component Manufacturer (OCM) specification(s) and the conditions agreed upon between the buyer and seller

Authorized (Franchised) Distributor:

Distributor authorized by an OCM to distribute its product lines

Blacktopped:

An intentional covering of the OCM part and markings

IDEA-STD-1010 Standard

Introduction to the IDEA-STD-1010 Standard

*Acceptability of Electronic Components
Distributed in the Open Market*

IDEA-STD-1010 Standard

IDEA-STD-1010

Provides inspection policies, processes, and techniques to help mitigate the acceptance of counterfeit and substandard parts

Standardized Inspection Processes and Criteria for:

- Independent Distributors
- Franchised Distributors
- Government (DoD, NASA)
- OCMs
- OEMs
- CMs and EMS Providers

Revision B – published April 2011

IDEA-STD-1010 Standard

- Why a standard?
 - Designed to serve the public interest through eliminating misunderstandings between suppliers and purchasers
 - Allows for
 - ❖ Manufacturers
 - ❖ Customers
 - ❖ Suppliers to better understand the other's expectations
 - Allows Distributors greater efficiencies in
 - ❖ Setting up and exercising their processes
 - ❖ To meet industry standards
 - ❖ Allowing the savings to be passed to their customers

IDEA-STD-1010 Standard

- About the standard
 - It is a deliberated collection of visual requirements to indicate the quality of electronic components which
 - Provides guidance in establishing
 - ❖ Inspection capability
 - ❖ Determining product quality resulting from
 - ❖ Visual and non-invasive inspection as
 - ❖ Acceptable or nonconforming
 - ❖ Based on technical facts and cosmetic indicators
 - Compiles acceptance requirements of electronic components for the Open Market to
 - ❖ Heightened level of confidence that indicates the products authenticity
 - ❖ Parts have been stored, handled, and packaged consistent with applicable industry standards
 - Acceptance of product that deviates from the target conditions
 - ❖ Agreed upon between the buyer and seller,
 - ❖ Which are outside of the scope of this Standard

IDEA-STD-1010 Standard

- Scope
 - This Standard sets forth
 - ❖ Practices and Requirements for visual examination
 - ❖ Discriminative criteria for electronic components
 - ❖ Product purchased and sold in the Open Market

IDEA-STD-1010 Standard

- New Format
 - Electronic industry recognized standards formats were reviewed
 - ❖ IPC
 - ❖ J-STD
 - To incorporate following attributes
 - ❖ Navigation
 - ❖ Readable
 - ❖ Clear
 - ❖ Concise
 - Pictures are worth 1000 words
 - ❖ Visual quality characteristics that lend for ease of identification

IDEA-STD-1010 Standard

- Table of contents

IDEA-STD-1010-B

IDEA-STD-1010 Standard

- Two column format

10 The Inspection

10.1 Packaging Inspection

10.1.1 General Packaging Rules and Guidelines

- A. The purchase order between buyer and seller should accurately identify in writing the packaging required for the order.
- B. It is also important to note that in cases where full factory sealed packaging (see Section 5, Terms and Definitions) is required or received, if direct traceability to the OCM is unavailable, then that seal has to be deemed as unverified. If an unverified, sealed carton is not opened for further inspection and the product is deemed to be factory sealed, this constitutes one of the most speculative determinations a Quality Inspector can make. It is as easy to counterfeit a factory seal as it is the product itself.
- C. At a minimum, the factory carton label should contain the lot number, date code, part number, country of origin, and the moisture sensitivity level (MSL) (if a non-hermetically sealed device.)
- D. Inner packaging and use of moisture barrier bag (MBB), desiccant, and Humidity Indicator Card (HIC) shall be in accordance with J-STD-033.

10.1.3 Classification/Clarification of Terms

Product can come in factory packaging. This is different than factory sealed (see Section 5, Terms and Definitions). It is important to have a lexicon of levels of packaging. Figure 10-1 shows the levels of package seal from outer to inner pack.

IDEA-STD-1010 Standard

- Visual Inspection process format

10.3.1 The Visual Inspection

EQUIPMENT:

Microscope
(1.5X to 40X magnification)
ESD Compliant Workstation

MATERIALS:

Finger Cots or Gloves
Vacuum Pen

DOCUMENTATION:

Component Datasheet

Microscope set-up:

The tolerance for magnification aids is $\pm 15\%$ of the selected magnification power. Magnification aids, if used for inspection, need to be appropriate for the item being inspected. Lighting needs to be adequate for the magnification aids used. The magnification used to inspect electronic components is based on the minimum width of the feature under inspection. Unless magnification requirements are otherwise specified by contractual documentation, the

magnifications are determined by the item being inspected (see Section 7.3, Table 3).

Component Data:

The component datasheet's revision or date issued should be consistent with the date code of the product being inspected. Markings, dimensions, electrical specifications, or assembly locations could be different depending on the date code and revision of the part.

Impacts of Counterfeiting

POST 2002

“Something’s Wrong!”

Good Product Example

- Expecting to see an indent (mold mark) with
 - Clean edge
 - No scratches
 - Not rough
 - Not grainy

Counterfeit Examples

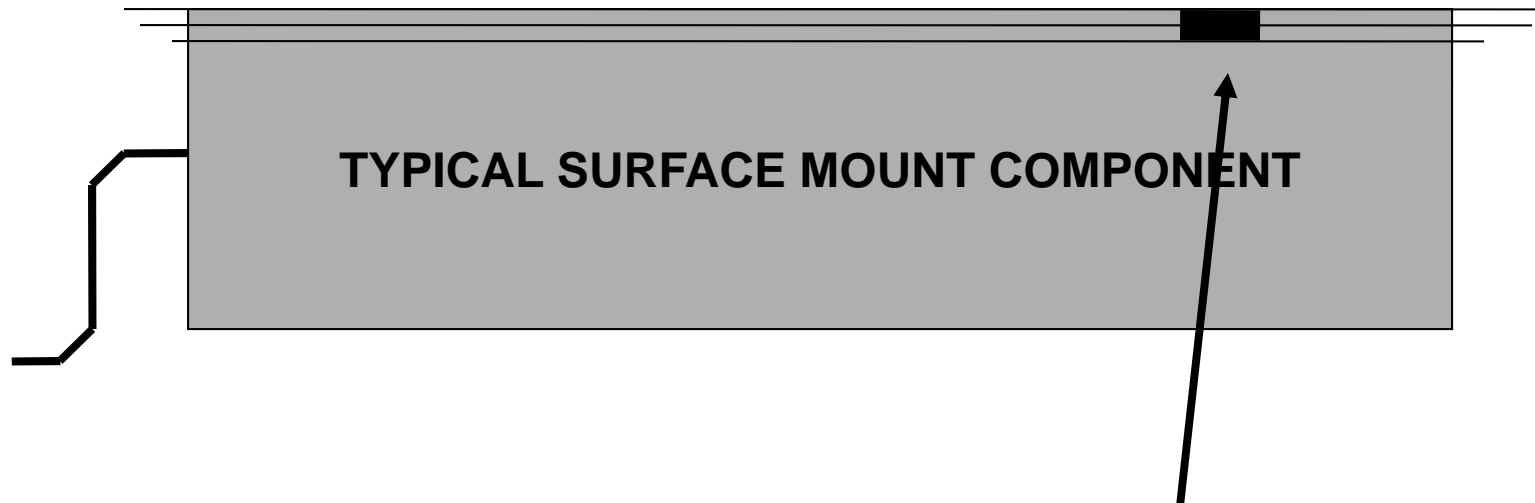

- Blacktopping evident in mold mark

Counterfeit Examples

- Pin 1 Depth

A Reworked component will have the top surface removed and recoated (Blacktopping) to hide the sanding scratches

If the top surface has been removed, the Pin 1 dimple will be ill-defined and grainy.

Counterfeit Examples

- Indication of surface removed
 - Mold mark almost gone

Inspection Processes

Rule #2

An Open Market inspection program requires increased inspection of parts and packaging materials by comparison to typical OCM and Franchised sources

Inspection Processes

- Nonconforming parts (guilty until proven innocent)
 - Inspectors shall consider parts as nonconforming until conformance is clearly indicated
 - Upon discovery of a substandard part attribute
 - ❖ Secure and isolate all suspect parts
 - ❖ Record all findings in a discrepancy report for review
 - Document the defect
 - ❖ Indicating the chapter and verse of IDEA-STD-1010
 - Have the substandard part and report Referee'd
 - ❖ This could be a supervisor, manager...
 - Referee will issue a final disposition
 - ❖ Accept the part(s)
 - ❖ Accept under conditions
 - With customer written concurrence
 - ❖ Reject the part(s)
 - ❖ Scrap the part(s)
 - Detailed instructions of how to dispose

Al Messerschmidt, Getty Images

Track1; Part 2

- Solvent tests for remarking and resurfacing are excellent counterfeit identification processes. Altering a part's surface (remarking, resurfacing, blacktopping, etc.) remains the preferred method of deception used by the counterfeiters.
- Being proficient in detecting this type of fraud is essential and is required in STD1010 and AS6081.

Track1; Part 2

- Discuss the relevance of existing marking permanency and resistance to solvents screening.

Track1; Part 2

- Demonstrate the proper application of the below noted screening processes and reveal evidence (using case studies, photos, etc.) of prior use, refurbishing and resurfacing detected as a result.
 - MIL-STD-883, Method 2015.13
 - Acetone
 - 1-Methyl 2-Pyrrolidinone
 - Dynasolve 750
 - Scrape test

Track1; Part 2

- Provide guidance relative to safety including proper personal protective equipment, ventilation and ignition sources.
- Assist attendees in ensuring false positive or false negative results are not generated during screening and address concerns that have arisen relative to applying certain screening processes to older date code parts.

Track1; Part 2

- Provide evidence of these processes being applied to known “golden” parts and demonstrate how the results compare to the processes being applied to suspect counterfeit parts.

Receiving Process

- Device Marking Test
 - Tests the component's marking for permanency
 - ❖ Logo, part number, date code, etc.
 - 3 parts mineral spirits, and 1 part IPA solution
 - ❖ This solution is not aggressive enough to test for blacktopping
 - Industry accepted marking permanency test
 - This process doesn't cover laser marking testing
 - The Device Marking Test described above is not a replacement for MIL-STD-883, Method 2015.13
 - *Check Federal and statutory environmental laws and Material Safety Data Sheets (MSDS) before purchasing, storing, handling, using, or disposing of any chemicals*

Receiving Process

- Results of the Marking Test

© 2009 IDEA www.idofea.org

Receiving Process

- Results of the Device Marking Test

Receiving Process

- Device Surface Test
 - Tests for a “non-epoxy” blacktopping that covers evidence of sanding (resurfacing) and original markings
 - Acetone
 - Acetone has no effect the authentic surface of a plastic part (PEM)
 - Shall not be used as a Marking Test
 - *Check Federal and statutory environmental laws and Material Safety Data Sheets (MSDS) before purchasing, storing, handling, using, or disposing of any chemicals.*

Receiving Process

- Suspect sanded texture on the left side
- Mold pin cavity is filled and of the same texture

- After chemically cleaned
- Sanding witness marks and the clean mold pin cavity (as it should look)
- This part is suspect

Receiving Process

- Results of a failed Device Surface Test

Receiving Process

- Results of a failed Device Surface Test

© 2009 IDEA www.idofea.org

Receiving Process

- Counterfeiters are evolving
 - Advanced Blacktopping
 - UV Bake - Impervious to Device Surface Test (Acetone)
 - ❖ Epoxy or polyurethane - like substance layer
 - ❖ This surface produces a 'high shine'
 - ❖ Should use the "Scrape Test"
 - Using an Exacto blade

<http://www.dickblick.com/products/x-acto-1-knife/>

Chemicals Elevated Temperatures

USE CAUTION!

- 1-Methyl 2-Pyrrolidinone
- Dynasolve 750
- Know the information on the Material Safety Data Sheets (MSDS)
- Only trained competent personnel
 - Set up the equipment, materials, process, and teaching instructions
 - Perform either of these tests

Receiving Process

- Cl⁻ Ion Plasma Etch
 - Removes markings and leaves surface identical to authentic
 - Recovery of sanded-off material
 - “Engineered-Blacktop-Material-Analysis-SMT-Corporation-PP-08-11-09-IDEA” pages 50-58

Receiving Process

- Blacktopping evident – Suspect

Receiving Process

- Remarked – Suspect

Receiving Process

- Suspect
 - Laser-Etch remarking still visible after black topping has been removed

Receiving Process

- Resurface – Suspect

Receiving Process

- Inconsistent surface textures
 - Indicates remarking
 - Suspect

Part 2 – G65SC22P-1

Fails – Marking and blacktop test

Part 3 – N07XXLMC64

Exhibits Two Nomenclatures

Part 3 – N07XXLMC64

Pin 1 filled in (absence of sharp edges)
Exhibits Two Nomenclatures

Part #4 – QPSK DMOD CX24123

Appearance of a thick glossy coating

Part #4 – QPSK DMOD CX24123

Appearance of re-topping at a mold mark

Part #4 – QPSK DMOD CX24123

Scratch marks in mold cavity.

However, numbers appear to be the same texture as part body

Part #4 – QPSK DMOD CX24123

Failed – Markings and Blacktop test

Part #6 – BCM5325A2KQM

Part #6 – BCM5325A2KQM

Backside is different texture than front

Part #6 – BCM5325A2KQM

Two different textures in mold and debris

Part #6 – BCM5325A2KQM

Fails - Marking Test

Part #6 – BCM5325A2KQM

Fails – Blacktop test

Part #7 – MT48LC4M32B2

Scratches indicate compromised quality
Fails – Marking test

Part #7 – MT48LC4M32B2

Surface texture appears “weave/cloth like”, not typical

Part #7 – MT48LC4M32B2

© 2009 IDEA www.idofea.org

Debris and scratches

Part #7 – MT48LC4M32B2

Contamination

Part #7 – MT48LC4M32B2

Fails-Blacktop test

Part #7 – MT48LC4M32B2

Removed Black-top

Part #8 – MAX406A

Before Acetone test

Part #8 – MAX406A

After Acetone test

Part #8 – MAX406A

Before vs. After Blacktop test
Passed – Markings test
Failed – Blacktop test

Part #9 – AT29C010A

Before and after Acetone test
Fails – Blacktop test

Part #9 – AT29C010A

Before and after Acetone test

Part #10 – AM29DL323DT

Passed – Markings test

Part #10 – AM29DL323DT

Crude ablation/erosion marking process

Part #10 – AM29DL323DT

© 2009 IDEA www.idofea.org

Part #10 – AM29DL323DT

Three different surface textures

Part #10 – AM29DL323DT

Appears that blacktopping material
has spilled into Pin 1 dimple

Part #10 – AM29DL323DT

Results of Acetone test

Part #10 – AM29DL323DT

Evidence of Black-topping on the cotton swab

Failed – Blacktop test

Part #10 – AM29DL323DT

After Acetone Test

Part #11 – DS2108S

Part #11 – DS2108S

Filled in Pin 1 dimple

Part #11 – DS2108S

© 2009 IDEA www.idofea.org

Part #11 – DS2108S

Double Marking; Magnification 70X

Part #11 – DS2108S

Double Marking; Magnification 200X

Part #11 – DS2108S

Passes – Marking test

Fails - Blacktop test

Part #12 – MAX173CNG

© 2009 IDEA www.idofea.org

Part #12 – MAX173CNG

Bottom side texture different from the top

Part #12 – MAX173CNG

What do you see?

Part #12 – MAX173CNG

Part #12 – MAX173CNG

Acetone removed some topping
while requiring vigorous rubbing

Part #12 – MAX173CNG

Scrape Test reveals original surface

Part #12 – MAX173CNG

“3CNG” “9115”

Part #12 – MAX173CNG

After Scraping: "2BCNG" "8829"

Part #12 – MAX173CNG

Before vs. After scraping
Passes – Marking test
Fails – Blacktop test

Part #14 – LH5164A-10L

Part #14 – LH5164A-10L

Mold marks are same texture as body

Part #14 – LH5164A-10L

Damaged leads

Part #14 – LH5164A-10L

Corrosion of lead

Part #17 – STV5730A

Two different Countries of Origin?

Part #17 – STV5730A

Passes – Marking test

Fails – Blacktop test

Summary

- Join industry associations such as IDEA & ERAI
- Visit, qualify, and certify your suppliers
- Utilize the IDEA-STD-1010 inspection standard
- Ensure your inspectors receive current training
- Certify your inspectors to IDEA-ICE-3000
- Enlist OCM assistance for suspect counterfeit parts
- Utilize IDEA, ERAI and GIDEP databases

Summary

- Inspect the nice appearing “factory sealed boxes”
- Validate bar code label content
- Utilize an optical microscope for inspection
- Photograph a sample of each component shipped
- Compare at least one component to the datasheet
- Use 3rd party escrow for foreign purchases
- Utilize companies associated with IDEA & ERAI
- Develop “Counterfeit Abatement Procedures”

Summary

- Use XRF to detect lead content for RoHS
- Utilize X-Ray equipment – easiest way to see inside
- DeCap a sample and inspect die markings
- Develop Testing resources relationships
